

Hands-on Lab: Stored Procedures in MySQL using phpMyAdmin

Estimated time needed: 20 minutes

In this lab, you will learn how to create tables and load data in the MySQL database service using the phpMyAdmin graphical user interface (GUI) tool.

Software Used in this Lab

In this lab, you will use MySQL. MySQL is a Relational Database Management System (RDBMS) designed to efficiently store, manipulate, and retrieve data.

To complete this lab you will utilize MySQL relational database service available as part of IBM Skills Network Labs (SN Labs) Cloud IDE. SN Labs is a virtual lab environment used in this course.

Database Used in this Lab

Mysql_learners database has been used in this lab.

Data Used in this Lab

The data used in this lab is internal data. You will be working on the **PETSALE** table.

ID 🔺	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	450.09	2018-05-29	9
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	60.60	2018-06-11	6
5	Goldfish	48.48	2018-06-14	24

This lab requires you to have the PETSALE table populated with sample data on mysql phpadmin interface. You might have created and populated a PETSALE table in a previous lab. But for this lab, it is recommended you download the PETSALE-CREATE-v2.sql script below, upload it to phpadmin console and run it. The script will create a new PETSALE table dropping any previous PETSALE table if exists, and will populate it with the required sample data.

• PETSALE-CREATE-v2.sql

Objectives

After completing this lab, you will be able to:

Create stored procedures

• Execute stored procedures

Exercise 1

Hide query box

In this exercise, you will create and execute a stored procedure to read data from a table on mysql phpadmin using SQL.

1. Make sure you have created and populated the **PETSALE** table following the steps in the "Data Used in this Lab" section of this lab.

1 Cat 450.09 2018-05-29 9 2 Dog 666.66 2018-06-01 3 3 Parrot 50.00 2018-06-04 2 4 Hamster 60.60 2018-06-11 6	ID 🔺	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
3 Parrot 50.00 2018-06-04 2	1	Cat	450.09	2018-05-29	9
	2	Dog	666.66	2018-06-01	3
4 Hamster 60.60 2018-06-11 6	3	Parrot	50.00	2018-06-04	2
	4	Hamster	60.60	2018-06-11	6
5 Goldfish 48.48 2018-06-14 24	5	Goldfish	48.48	2018-06-14	24

- 2. You will create a stored procedure routine named **RETRIEVE_ALL**.
 - This **RETRIEVE_ALL** routine will contain an SQL query to retrieve all the records from the PETSALE table, so you don't need to write the same query over and over again. You just call the stored procedure routine to execute the query everytime.
 - To create the stored procedure routine, copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

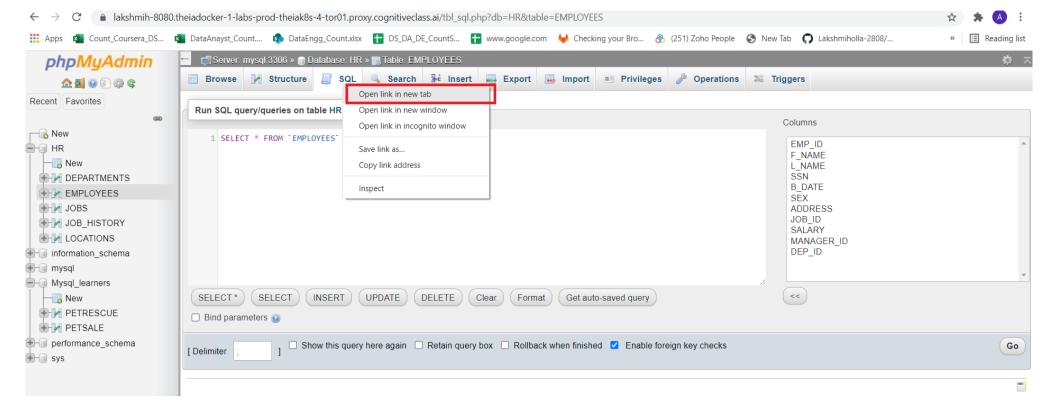

```
DELIMITER //
CREATE PROCEDURE RETRIEVE_ALL()
BEGIN
          SELECT * FROM PETSALE;
END //
DELIMITER;
    Run SQL query/queries on database Mysql_learners: 🔞
       1 DELIMITER //
       3 CREATE PROCEDURE RETRIEVE_ALL()
            SELECT * FROM PETSALE;
      10 END //
       11
       12 DELIMITER;
    Clear ) ( Format ) ( Get auto-saved query
   □ Bind parameters (2)
                       □ Show this query here again □ Retain query box □ Rollback when finished ☑ Enable foreign key checks
                                                                                                                                                                      Go
   [ Delimiter
```

[Edit inline] [Edit] [Create PHP code]

3. To call the RETRIEVE_ALL routine, open another **SQL** tab by clicking **Open in new Tab**

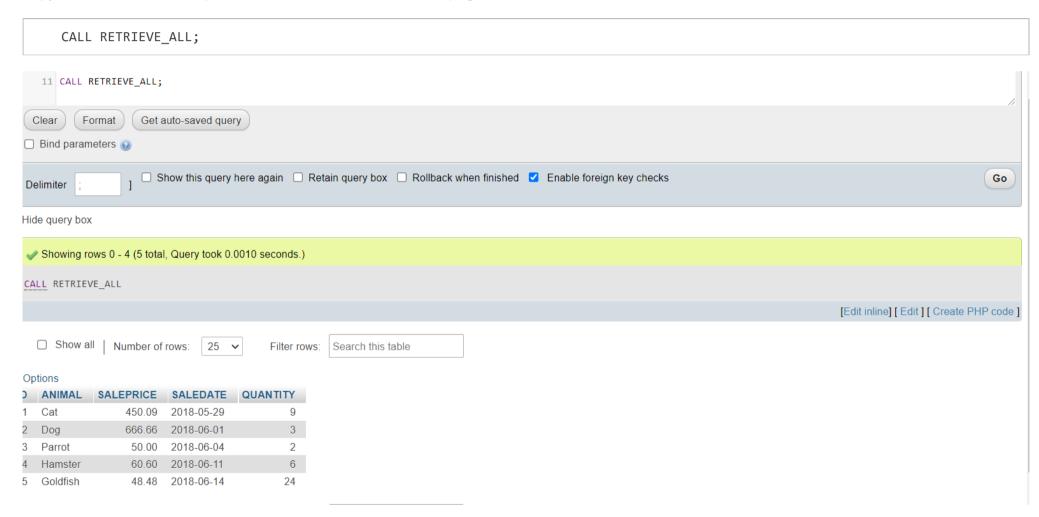

MySQL returned an empty result set (i.e. zero rows). (Query took 0.0064 seconds.)

CREATE PROCEDURE RETRIEVE_ALL() BEGIN SELECT * FROM PETSALE; END

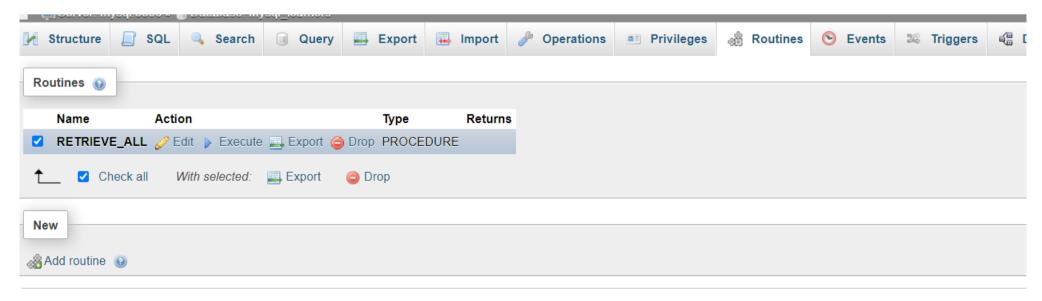

Delete the default line which appears so that you will get a blank window.

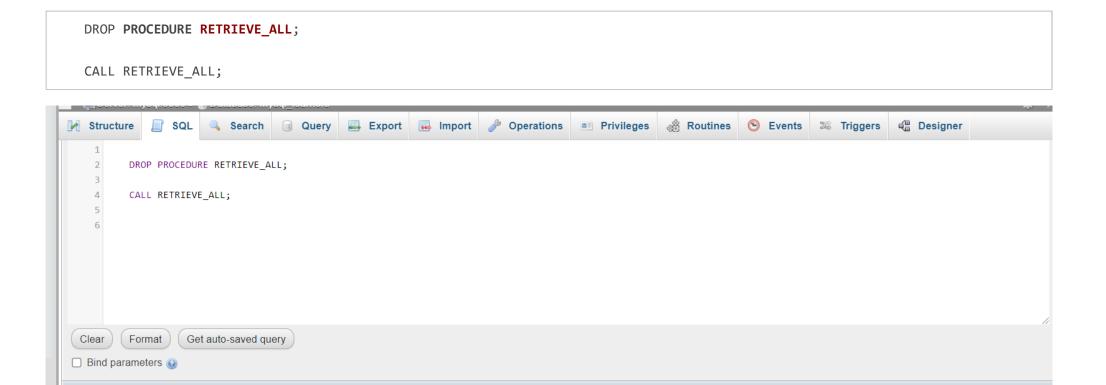

copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

4. You can view the created stored procedure routine RETRIEVE_ALL. Click on the Routines and view the procedure.

5. If you wish to drop the stored procedure routine RETRIEVE_ALL, copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

Go

[Delimiter

CALL RETRIEVE_ALL

MySQL said: 🤢

#1305 - PROCEDURE Mysql_learners.RETRIEVE_ALL does not exist

Exercise 2

In this exercise, you will create and execute a stored procedure to write/modify data in a table on Db2 using SQL.

☐ Show this query here again ☐ Retain query box ☐ Rollback when finished ☑ Enable foreign key checks

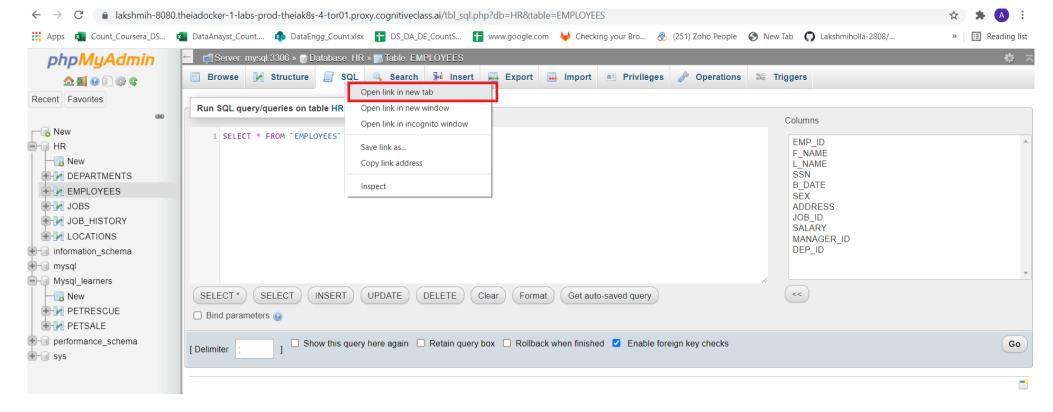

1. Make sure you have created and populated the **PETSALE** table following the steps in the "Data Used in this Lab" section of this lab.

- 2. You will create a stored procedure routine named **UPDATE_SALEPRICE** with parameters **Animal_ID** and **Animal_Health**.
 - This **UPDATE_SALEPRICE** routine will contain SQL queries to update the sale price of the animals in the PETSALE table depending on their health conditions, **BAD** or **WORSE**.
 - This procedure routine will take animal ID and health condition as parameters which will be used to update the sale price of animal in the PETSALE table by an amount depending on their health condition. Suppose -
 - For animal with ID XX having BAD health condition, the sale price will be reduced further by 25%.
 - For animal with ID YY having WORSE health condition, the sale price will be reduced further by 50%.
 - For animal with ID ZZ having other health condition, the sale price won't change.
- To create the stored procedure routine, copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

```
DELIMITER @
CREATE PROCEDURE UPDATE_SALEPRICE (
   IN Animal_ID INTEGER, IN Animal_Health VARCHAR(5) )
BEGIN
   IF Animal_Health = 'BAD' THEN
        UPDATE PETSALE
        SET SALEPRICE = SALEPRICE - (SALEPRICE * 0.25)
        WHERE ID = Animal_ID;
   ELSEIF Animal_Health = 'WORSE' THEN
        UPDATE PETSALE
        SET SALEPRICE = SALEPRICE - (SALEPRICE * 0.5)
        WHERE ID = Animal_ID;
   ELSE
        UPDATE PETSALE
        SET SALEPRICE = SALEPRICE
        WHERE ID = Animal_ID;
   END IF;
END @
DELIMITER;
            SQL
                     Search  Query
                                          Export Import
                                                                Operations
                                                                              Privileges  Routines
                                                                                                       Events
                                                                                                                              Designer
 15
   16
         ELSE
          UPDATE PETSALE
   17
            SET SALEPRICE = SALEPRICE
   18
   19
            WHERE ID = Animal_ID;
   20
   21
        END IF;
   22
   23 END @
   24
   25 DELIMITER;
   26
       Format
                 Get auto-saved query
 Clear
□ Bind parameters (2)
                  Show this query here again ☐ Retain query box ☐ Rollback when finished ☑ Enable foreign key checks
                                                                                                                                                    Go
[ Delimiter
Hide query box
 MySQL returned an empty result set (i.e. zero rows). (Query took 0.0214 seconds.)
CREATE PROCEDURE UPDATE_SALEPRICE ( IN Animal_ID INTEGER, IN Animal_Health VARCHAR(5) ) BEGIN IF Animal_Health = 'BAD' THEN UPDATE PETSALE SET SALEPRICE = SALEPRICE
(SALEPRICE * 0.25) WHERE ID = Animal_ID; ELSEIF Animal_Health = 'WORSE' THEN UPDATE PETSALE SET SALEPRICE = SALEPRICE * 0.5) WHERE ID = Animal_ID; ELSE UPDATE
PETSALE <u>SET</u> SALEPRICE = SALEPRICE WHERE ID = Animal_ID; END <u>IF</u>; END
                                                                                                                             [Edit inline] [ Edit ] [ Create PHP code ]
```

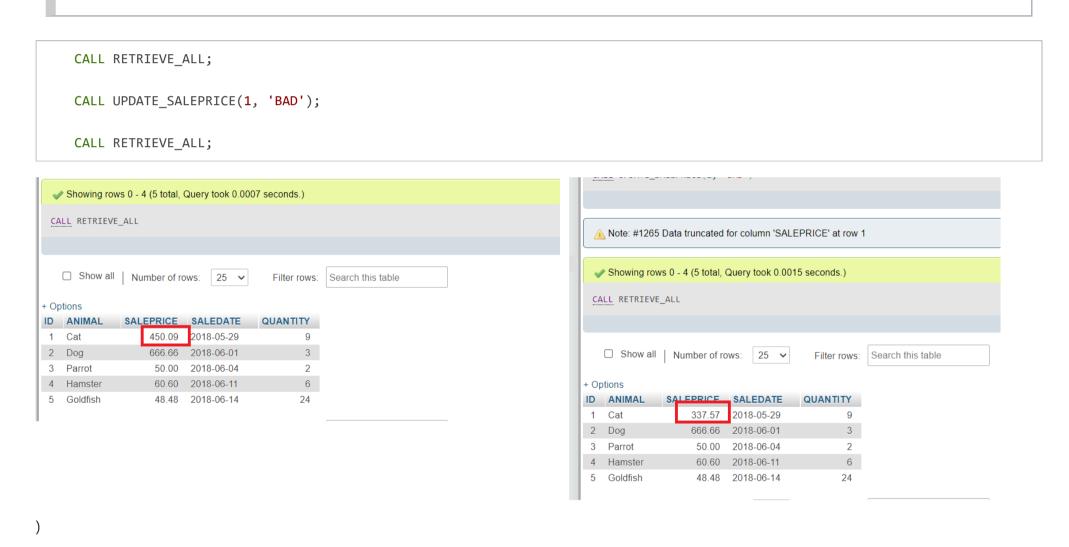

3. Let's call the UPDATE_SALEPRICE routine. We want to update the sale price of animal with ID 1 having BAD health condition in the PETSALE table. open another SQL tab by clicking Open in new Tab

Delete the default line which appears so that you will get a blank window.

copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

Note if you have dropped RETREIVE_ALL procedure rerun the creation script of that procedure before executing these lines.

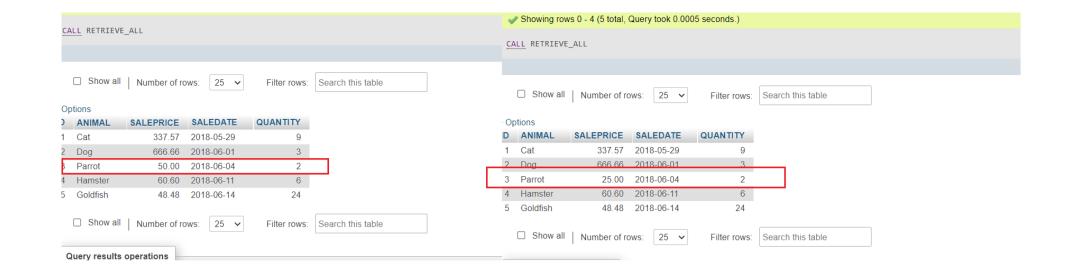

4. Let's call the UPDATE_SALEPRICE routine once again. We want to update the sale price of animal with ID **3** having **WORSE** health condition in the PETSALE table. copy the code below and paste it to the textarea of the **SQL** page. Click **Go**. You will have all the records retrieved from the PETSALE table.

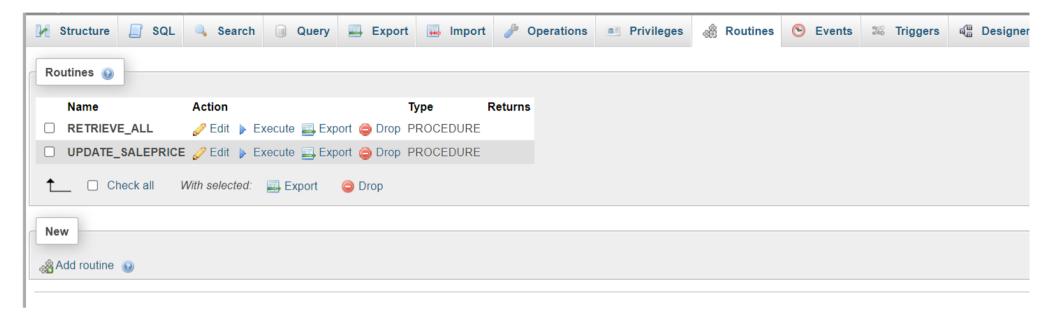

```
CALL RETRIEVE_ALL;

CALL UPDATE_SALEPRICE(3, 'WORSE');

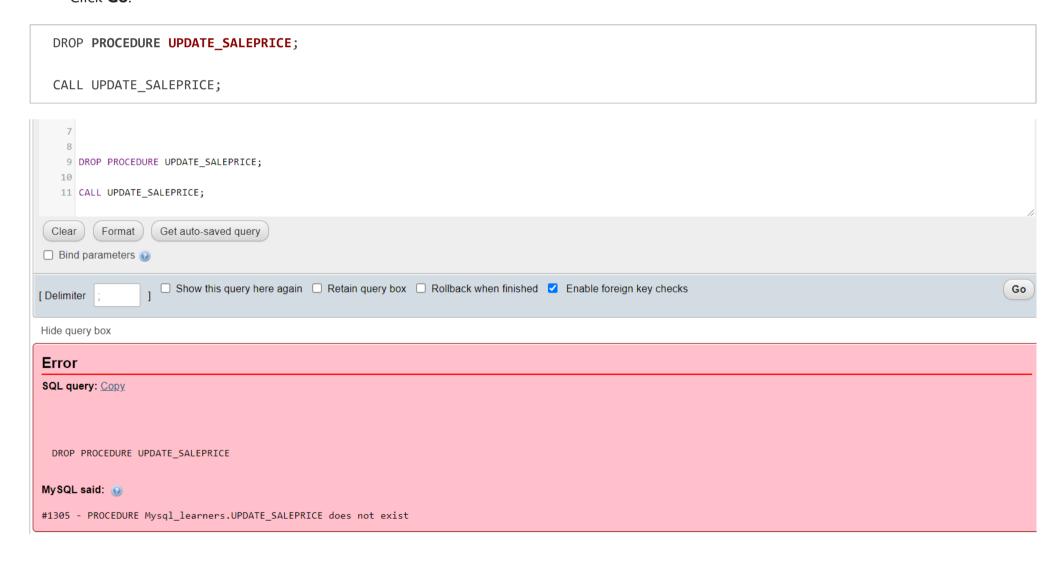

CALL RETRIEVE_ALL;
```

5. You can view the created stored procedure routine UPDATE_SALEPRICE. Click on the Routines and view the procedure.

6. If you wish to drop the stored procedure routine UPDATE_SALEPRICE, copy the code below and paste it to the textarea of the **SQL** page. Click **Go**.

Congratulations! You have completed this lab, and you are ready for the next topic.
